

MOHIT GUJARATI

Phoenix, AZ • +1 (201)-423-0193 • [linkedin.com/in/mohitgujarati/](https://www.linkedin.com/in/mohitgujarati/) • <https://github.com/MohitGujarati> • mohitgujarati11@gmail.com

Full-stack Software Engineer with 2 years of professional experience delivering mobile and web applications using Kotlin, React Native, React, and Next.js. Building scalable data layers (Room, AWS, Supabase, Firebase), integrating RESTful APIs, and developing AI products.

EDUCATION

- Master of Science in Computer Science**
Long Island University | **GPA 3.9/4.0**
 - Bachelor of Technology in Computer Engineering**
Shankersinh Vaghela Institute of Technology
- Sep 2024 - May 2026**
Brooklyn, New York

Aug 2016- Sep 2020
Gujarat, India

SKILLS

- Programming Languages:** Kotlin, Java, Python, JavaScript, TypeScript, SQL.
- Tools and Architecture:** React, React Native, React 19, Next.js (App Router, static export), MUI, Framer Motion, Jetpack Compose, Android SDK, Expo, Express.js, REST APIs, Retrofit, Gemini API, WebSocket, Server-Sent Events (SSE), MVVM, Clean Architecture, Dependency Injection, Hilt, Kotlin Coroutines, Flow, StateFlow, LiveData, Re-Act Agent Architecture, Offline-First Development, PostgreSQL, SQLite, Room, Supabase, Firebase (Firestore, Crashlytics, App Check), Google Cloud, AWS Amplify, HubSpot, Git, GitHub, GitHub Actions, Agile/Scrum.
- Certificates:** Excellence Award in Graduate Computer Science by LIU Brooklyn, Kotlin Professional Certificate by JetBrains.

PROFESSIONAL EXPERIENCE

- Full-Stack Engineer, Gabriel AI.**

 - Led the migration of the customer-facing marketing site from a client-rendered React app to a Next.js static export (19 routes + CMS-driven blog), taking Lighthouse SEO from unmeasurable to 100 on every page, cutting image payload by 86%, and making all content crawlable to search engines and AI bots for the first time; deployed on AWS Amplify with build config, env management, and a one-command audit script (crawlability, structured data, sitemap, Lighthouse) that gates releases.
 - Design, build, and ship features across the platform: responsive front-end for the dashboard and web app, back-end APIs and database logic, and AI voice calling workflows, including third-party integrations with CRMs (HubSpot) and lead sources, Contentful CMS, GA4 conversion tracking, and Cloudflare Turnstile.
 - Own code quality end-to-end: write tested, maintainable code, debug issues across the stack, run structured data and performance audits against Google's requirements, and collaborate with product, design, and marketing through code reviews and cross-team planning to deliver reliable releases.
- Software Engineer, TNM Software Solutions**

 - Reduced device power consumption by 30% fleet-wide by building battery-efficient location services in Kotlin using Google Geofencing API and motion sensors to optimize GPS polling. Improved app performance by 50% and removed UI-thread bottlenecks by refactoring the legacy codebase to MVVM with Kotlin Coroutines for non-blocking I/O.
 - Shipped production Android and Web apps from scratch, accelerating release velocity through daily stand-ups and weekly sprints with Backend and QA.
- Software Engineer Trainee, Tops Technology Inc.**

 - Improved user engagement metrics by building and deploying intuitive user-facing features using Android UI components and Material Design in Kotlin, applying mobile app development best practices, and publishing to the Google Play Store.
 - Designed optimized Room/SQLite database schemas with normalized relationships, improving query performance and enabling reliable offline-first data sync. Enforced a clean separation of concerns across UI, domain, and data layers by structuring MVVM repositories to integrate RESTful APIs via Retrofit, Kotlin Coroutines, and LiveData.

PROJECTS

- Shop Circle – Social Ecommerce App • React Native, Expo, TypeScript, Supabase, Algolia, GitHub Actions**

 - Built a cross-platform social commerce app in React Native, Expo, and TypeScript on a Supabase/PostgreSQL backend, delivering a combined feed of posts and products, multi-image uploads, optimistic likes, ranked discovery, and Algolia-powered typo-tolerant search.
 - Designed a relational schema spanning 6 tables, 10 SQL migrations, and 2 engagement-ranked views, secured through PostgreSQL Row-Level Security (RLS) instead of application code, added Google OAuth and username-based login with deep-link callback handling, and scoped a CI/CD pipeline (GitHub Actions → signed APK → Firebase App Distribution) for fully automated releases.
- Recall AI – Intelligent Meeting Assistant • Kotlin, Compose UI, Coroutines, Flow, Room, MVVM, Hilt, GitHub**

 - Established a highly scalable, decoupled application architecture by building a fully declarative UI from scratch, utilizing Jetpack Compose, MVVM, and Hilt for robust dependency injection.
 - Powered an autonomous, voice-driven Live AI assistant capable of concurrent audio transcription, contextual meeting Q&A, and automated task execution (e.g., setting alarms and reminders for to-dos) by engineering a real-time streaming pipeline via the Gemini API, Kotlin Coroutines, and StateFlow. Implemented GitHub Actions CI/CD pipeline to automate secure API key injection, unit testing, linting, and continuous delivery of test builds via Firebase App Distribution.
 - Delivered a seamless offline-first experience with instant UI synchronization by developing a reactive persistence layer using Room database, normalized schemas, and SQL-to-Flow queries.
- Lummina – AI-Powered Learning Platform • React 19, Vite, Express.js, Gemini API, Supabase, WebSocket**

 - Built a full-stack AI learning platform using React 19 and Express.js, designing REST APIs for streaming chat, quiz generation, AI grading, study guides, and real-time voice examinations. Designed a secure backend architecture where AI requests flow through Express, keeping Gemini and Supabase service credentials server-side while streaming responses to the React client via SSE.
 - Engineered a ReAct-based AI agent orchestrator with multi-step task pipelines, structured outputs, and quality validation that automatically retries generated quizzes scoring below 70%. Implemented real-time voice exams via WebSockets and Gemini Live for bidirectional audio streaming.
